Java Examples

1. About

Part of this software can be used to create and verify arbitrary forms of XML Signatures. The documentation available here is not very huge; my first approach is to supply usage examples which are available in the `src_samples/` directory to give interested users a first starting point to jump-start with XML Signature.

Note:

The samples divide into two groups: Samples that *create* and samples that *verify* Signatures. Eventually, you should adjust the verifying program to another filename if you get `FileNotFoundExceptions`.

FIXME (KW):

We should add more information here.
