

More security with DNSSEC

Always be at the right place.

With the help of cryptographic signatures, DNSSEC protects you from being misled and helps you reach exactly the address you typed into your browser.

More security: simple and easy.

As a normal Internet user you don't have to do anything, if your ISP supports DNSSEC.

As a domain holder, the operator of the name server has to enable DNSSEC for you.

Check it out.

Is your domain already secured with DNSSEC? Ask your ISP / web hoster or go to nic.ch and make a whois query for your domain name.

Registrars, ISPs and web hosters that support DNSSEC help making the internet a more secure place.
